

## Experience with aloe vera / Theme Cancer

---

### Radiotherapy for cancer

Experience with aloe vera gel with honey

I have been drinking aloe vera on a daily basis since July 2002. I suffer from a plasmacytoma (leukaemia) that grows within the skeleton. Through the intake of aloe, my cancer of the skeleton was contained within 10 radiotherapy sessions. The outlook was one radiotherapy session a day for five weeks. Thanks to aloe, I spared myself three weeks of radiotherapy. My digestion has also improved so that I can now eat foods that used to cause severe nausea, heartburn and biliary colic. I have had viruses in my eyes for about ten years. Outlook: untreatable, may lead to blindness. After approx. 10-14 days of taking aloe vera I could suddenly read the newspaper again.

### Chemotherapy

Experience with aloe vera gel

Thanks to a recommendation to take aloe vera drinking gel, I did not have any side effects whatsoever during my chemotherapy session. Four weeks before commencing chemotherapy I started drinking 100 ml of gel a day. After only two weeks I noticed that my fatigue improved. Before taking aloe vera gel I also suffered from hypertension and according to my doctor I had to take blood pressure tablets. Meanwhile I have normal blood pressure without taking tablets. Thanks to aloe vera gel.

Christa U.

### Our own experience

On 13 August 2002 we were faced with one of the worst messages a person can receive!!

Our son Tim, who was almost three years old, had leukaemia. Until then I had heard of the illness and all we could do was hope that allopathic medicine could help our son. As I had received repeated reports on the wondrous healing properties of aloe vera I obtained more information - as my sole chance of helping him. I studied literature/internet/experience and opinions of doctors and professors who specialised in oncology. What I found out about aloe vera in concomitant treatment for cancer would surely have seemed incredible to someone who was not affected. It did not take us long to make a decision and so, from day one, we supported his chemotherapy with aloe vera gel - due to the conviction we gained from the scientifically proven studies. As my wife accompanies the therapy in hospital on a daily basis and I also visit my son on a regular basis, we also see the many other children and adolescents and the range of side effects (hair loss, constant vomiting, nausea, fatigue, bad organ parameters, e.g. liver).

## Experience with aloe vera / Theme Cancer

---

Tim has been undergoing chemotherapy for nine weeks now and I am pleased to say that he experiences these side effects noticeably rarely, if at all.

He has lost a bit of hair and over the entire nine weeks he only vomited once, he does not really suffer from nausea to any extent as I always see him happy, joyous and full of joie de vivre, wanting to play. He was even able to celebrate his third birthday at home with all his friends. Occasionally he is tired but not more than a healthy kid would be and both his blood parameters and organs are monitored on a regular basis. Even in this context, there have been comments as to the fact that the values are astonishingly positive.

Yes, I do believe that all these experiences we have had are due to aloe vera, as the literature from studies described precisely this positive effect and the fact that it is mandatory in some US American states, to undertake aloe vera treatment alongside chemotherapy and radiotherapy. All this convinces me all the more that this plant is not just another product. Thank you for introducing this marvellous product to us at just the right time so that our son and many other people could be helped to regain their health faster and maintain it easier.
